Quick Technology Health Check

Safe first checks for everyday computer, internet and data problems.

Start simple. Protect your data. Avoid making a small problem worse.

Low-risk checks only; not a substitute for qualified electrical, network, cybersecurity or repair work.

1 Slow computer

Restart. Close unused apps/tabs, check free storage, and install normal system updates. Avoid unknown cleaner apps.

2 Wi-Fi drops

Check other devices, restart the router once, move closer, and confirm power/cables. Avoid random setting changes.

3 Printer will not print

Check paper, ink/toner, power, connection and selected printer. Clear a stuck print queue first.

4 Storage almost full

Remove unnecessary downloads, empty recycle bin, and move large archives. Do not delete system folders.

5 File seems missing

Search by name/type; check Recent files, Recycle Bin/Trash, shared folders and cloud version history.

6 Suspicious email/link

Do not open or enter passwords. Verify the sender another way. If clicked, change the password from a trusted device.

7 Passwords are shared

Use individual accounts, unique passwords and multi-factor authentication on important accounts.

8 No reliable backup

Keep at least one separate backup and test a restore. Sync alone may not be a complete backup.

9 Overheating/unstable

Shut down if unusually hot, burnt-smelling, sparking, swollen or repeatedly powering off. Do not open power equipment.

10 Updates keep failing

Record the error, confirm date/time and internet access, restart once, retry, then escalate repeated failures.

STOP AND GET HELP WHEN:

burning smell, sparks, liquid damage, swollen battery, repeated data loss, suspected ransomware, unknown administrator account, or a problem affecting critical business systems.
